PROFILE SUMMARY

Software Engineer with 1.5 years building payment and event-driven systems at Vymo, a Bangalore-based product company. Comfortable owning a service end-to-end – API design, Kafka-based async workflows, and production debugging. Strongest with Node.js, Express, Kafka, and PostgreSQL. Available for immediate joining.

EXPERIENCE

VYMO-ASIA

Kormangala, Bangalore

Software Engineer

May 2025 – Present

- Moved the payment flow from synchronous calls to a Kafka-based event pipeline, cutting failed transactions during peak load by 40%
- Added retry logic and a Dead Letter Queue to Kafka consumers after recurring event drops were causing silent payment mismatches – the pattern was later adopted by two other services on the team
- Built a fault-tolerant batch reconciliation pipeline processing 10K+ daily transactions, with automated recovery for failed batches instead of manual re-runs
- Designed REST APIs with JWT auth and role-based access control for internal tooling used by 50+ employees
- On-call for the payment service; resolved 50+ production incidents, most within 30 minutes, by building better logging around the failure points we kept hitting

MOUNTBLUE TECHNOLOGIES

JP Nagar, Bangalore

Software Engineer

Jan 2025 – May 2025

- Built 20+ REST APIs across Express and Spring Boot for a product used by 500+ daily active users, averaging under 200ms response time
- Implemented JWT-based auth with three role tiers (Admin/Manager/User)
- Designed 10+ PostgreSQL schemas; added indexes after profiling slow queries, cutting execution time by 40% on the worst offenders
- Structured services around MVC with centralized error-handling middleware, replacing scattered try/catch blocks across route handlers

PROJECTS

Event-Driven GitHub Automation Bot | *React, Material UI, Node.js, Express, PostgreSQL* Jun 2026 – Jul 2026

- Built and deployed a full-stack automation platform with GitHub OAuth, searchable repository selection, configurable issue-triage rules, and an authenticated activity dashboard
- Automated GitHub issue labeling and developer assignment through the GitHub API, with Slack alerts and persistent action results for issues, pull requests, and push events
- Designed a durable PostgreSQL workflow queue with retry limits, stale-job recovery, exponential delays, and `FOR UPDATE SKIP LOCKED` for safe concurrent processing
- Secured integrations using HMAC-SHA256 webhook verification, OAuth state validation, unique delivery IDs for idempotency, and AES-256-GCM token encryption
- Added structured Winston logging with trace IDs and 12 automated backend test suites covering webhooks, retries, GitHub actions, Slack notifications, pagination, and credential security

TECHNICAL SKILLS

Backend: Node.js, Express.js, Java, Spring Boot, Spring MVC, REST APIs

Messaging & Streaming: Apache Kafka, RabbitMQ, Event-Driven Architecture

Databases: PostgreSQL, MySQL, MongoDB, Query Optimization, Indexing, Connection Pooling

Real-time: WebRTC, Socket.io, WebSockets

Security: JWT, OAuth2, RBAC, Spring Security, Stateless Sessions

DevOps & Tools: Docker, AWS (EC2, RDS, S3), Nginx, PM2, Git, Linux, Postman

Node.js Ecosystem: npm/yarn, Clustering, Async/Await, Event Loop, Streams

EDUCATION

Government College of Engineering Nagpur | B.Tech in Electronics and Telecommunication | Aug 2020 - Jun 2024
